

Changing Security Preferences for Mountain Lion 10.8

Mountain Lion 10.8 added a new security measure. This does not mean our software is not safe. You must follow the steps below to download and launch our software successfully.

In the System Preferences, go to the Security & Privacy section, and make sure that “Anywhere” is chosen under “Allow applications downloaded from:”

This will allow you to launch any application downloaded from the internet.

This is the default. Change setting to “Anywhere”.

You must unlock this before you can make changes. You must be an administrator or know the administrator password.
